

ADJUSTABLE HAIR ROLLER

Abstract

An adjustable hair roller having a body and an adjustment mechanism is disclosed. The body includes an outer surface that engages with strands of hair, and an inner surface defining an area within which is disposed the adjustment mechanism. The adjustment mechanism may include a first portion and a second portion, located on a first half and second half of the inner surface of the body, respectively. The first and second portions engage with one another, thereby changing a profile of the body of the roller from a first shape to a second shape.
